

Tutorial 2 - Developing a Web Site

Tutorial 2, Math279, Fall 2013

1

Quick review

- ❑ Four basic HTML tags
- ❑ Block-level elements
 - contain content viewed as distinct block within webpage
 - when rendered visually, start on a new line
 - example?
- ❑ In-line elements
 - marks a section of text within a block-level element
 - example?

Tutorial 2, Math279, Fall 2013

2

Working with Web Site Structures

- ❑ A well-designed structure ensures users
 - navigate the site
 - not get lost or miss important information
- ❑ A **storyboard** is a diagram of a Web site's structure
 - shows all pages in a site
 - indicates how the pages are linked together
 - defines a structure works best for the type of information of the site

Tutorial 2, Math279, Fall 2013

3

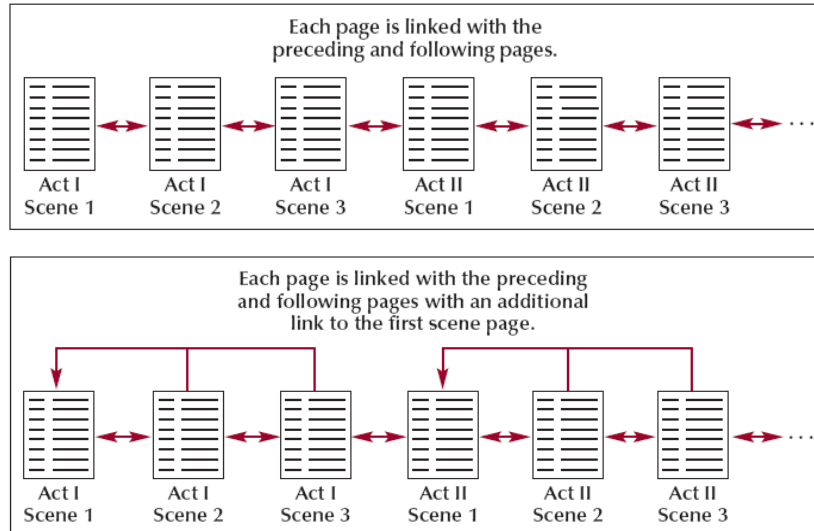

Linear Structures

- ❑ each page is linked with the page follows and the page precedes it in a chain
- ❑ works best for Web pages with a clearly defined order
- ❑ commonly, each page contains an additional link back to an opening page

Tutorial 2, Math279, Fall 2013

4

Linear Structures

Tutorial 2, Math279, Fall 2013

5

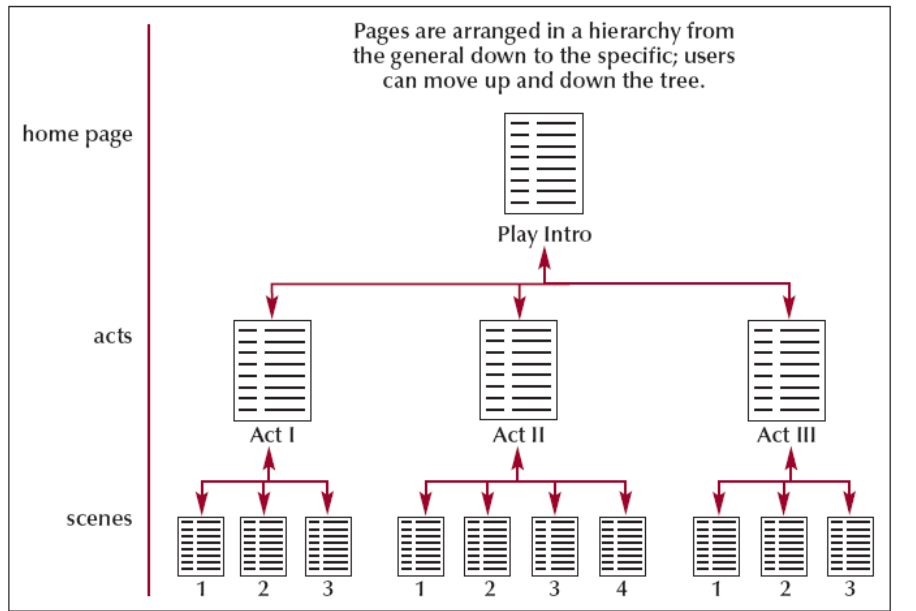

Hierarchical Structures

- ❑ pages are linked going from the *home page* down to more specific pages
- ❑ users easily move from *general* to *specific* and back
- ❑ a user can move quickly to a specific page without moving through each page in order

Tutorial 2, Math279, Fall 2013

6

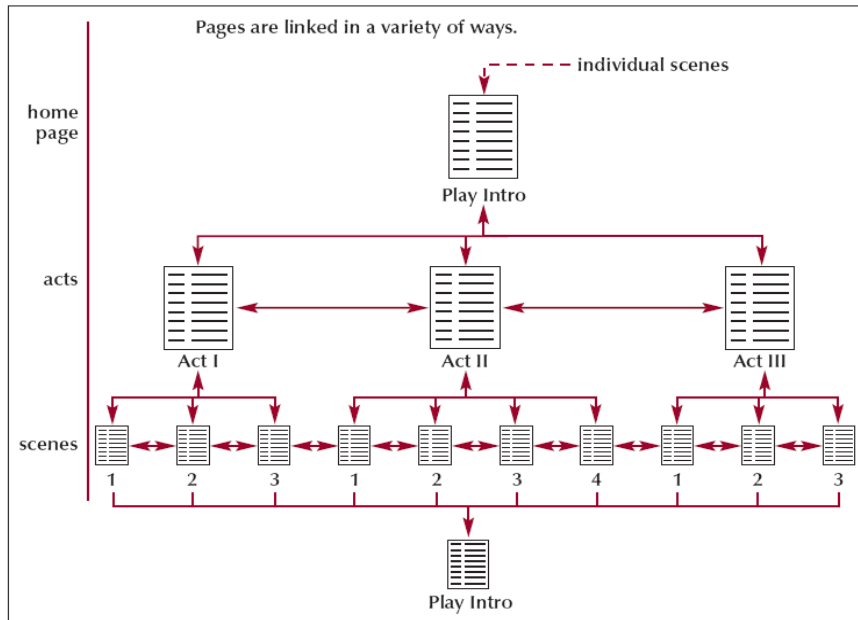

Hierarchical Structures

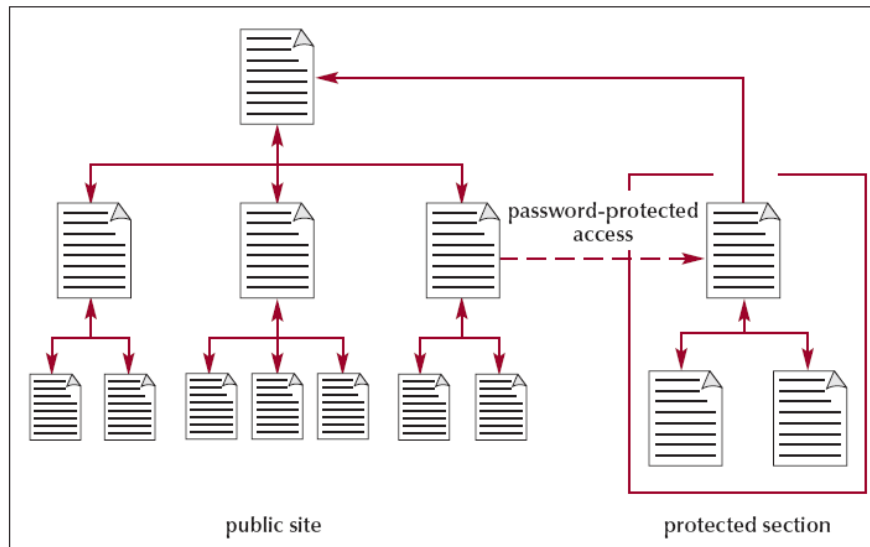

Mixed Structures

- ❑ overall form **hierarchical**, allowing the user to move from general to specific
- ❑ in the same time, links allow users to move through the site in a **linear** fashion

Mixed Structures

Protected Structures

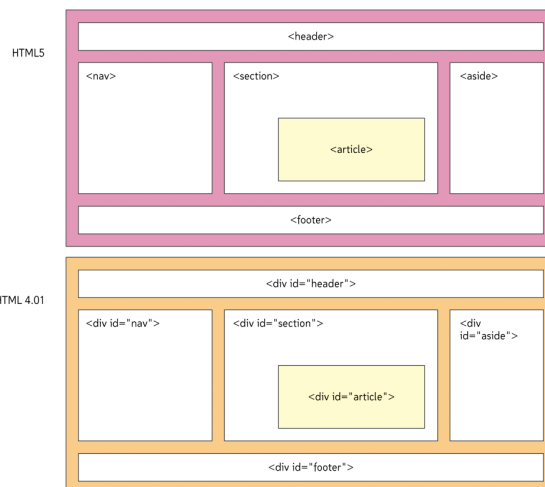

Structural Elements in HTML5

- ❑ To mark the page header, use the `<header>` element
- ❑ To mark the page footer, use the `<footer>` element
- ❑ To mark a main section of page content, use the `<section>` element
- ❑ To mark a sidebar, use the `<aside>` element
- ❑ To mark an article, use the `<article>` element
- ❑ To mark an navigation list, use the `<nav>` element

Tutorial 2, Math279, Fall 2013

11

Marking a Section with the `<div>` Element

Tutorial 2, Math279, Fall 2013

12

Creating a Hypertext Link

Tutorial 2, Math279, Fall 2013

13

Hyperlinks

□ Hyperlink

“A clickable HTML element that will direct the web browser to display a different Web page or a different location on the current Web page.”

□ Three type of HTML links

- **Relative URL**
 - links to a Web page on the same Web server
 - only need relative directory for the linked file
- **Absolute URL**
 - links to a Web page on a different Web server
 - a complete URL should be used
 - e.g., <http://web.cs.gc.cuny.edu/~jchu/math279/>
- **Name id**
 - links to a different location on the same **Web page**

Tutorial 2, Math279, Fall 2013

14

Hyperlink Components

- ❑ use anchor tags `<a>...`, and *href* attribute
 - *href* = “a link destination”
- ❑ link label
 - visible link on a Web page
 - can be text or image
- ❑ link destination
 - the target destination
 - other web pages, or files (e.g., ppt, pdf files)
- ❑ example

` Tips `

link label, visible on a Web page

Tutorial 2, Math279, Fall 2013

15

More on Hypertext Link

- ❑ filenames are case sensitive on some operating systems, including the UNIX and Macintosh
- ❑ current standard is to use lowercase filenames and avoid special characters such as blanks and slashes
- ❑ keep filenames short to avoid typing errors

Tutorial 2, Math279, Fall 2013

16

Exercise

- ❑ download [CAMShots.zip](#)
- ❑ modify [hometxt.htm](#), [tipstxt.htm](#) and [glosstxt.htm](#) by adding your name and today's date info in the comment section of each document
- ❑ RENAME these documents to [home.htm](#), [tips.htm](#) and [glossary.htm](#) respectively
- ❑ in [home.htm](#), add navigation list and hyperlinks as shown in following slide

Tutorial 2, Math279, Fall 2013

17

Exercise (cont.)

```
<nav>
  <ul>
    <li><a href="home.htm">Home</a></li>
    <li><a href="tips.htm">Tips</a></li>
    <li><a href="glossary.htm">Glossary</a></li>
  </ul>
</nav>
```

hypertext links
underlined by default

Tutorial 2, Math279, Fall 2013

18

Using id Attribute

- ❑ id attribute assigns a *name* (or an *ID*) to an element
- ❑ with the ID, an element can be referred to easily
- ❑ syntax

```
<element id="name"> content </element>
```

```
<element id="name" />
```

e.g.,

```
<h1 id="mainhead"> Dave's Devil Sticks</h1>
```

```
<h2 id="A"> A </h2>
```

- ❑ Note:
 - id names must be unique
 - id names are case sensitive

Creating *hyperlinks* to locations in same document

- ❑ use id attribute to identify the destination of the hyperlinks
- ❑ syntax

```
<a href="#id_name"> content </a>
```

e.g.,

```
<a href="#a">A</a>
```
- ❑ note
 - a link's content is not limited to text
 - generally, a link should not contain any block-level elements

Exercise

□ In glossary.htm

- add navigation list for letters A to Z
- add hyperlinks for letters A, B, C, D, E, F on top of the page
- add id names to H2 elements of the glossary entries A, B, C, D, E, F
- E.g.
 - [`A `]
 - [`B `]
 - [`C `]
 - `<h2 id="A"> A </h2>`
 - `<h2 id="B"> B </h2>`
 - `<h2 id="c"> C </h2>`

Tutorial 2, Math279, Fall 2013

21

Creating hyperlinks between documents

- use **id** attribute to identify the destination of the hyperlinks
- create a hyperlink specific location in another file with syntax

```
<a href="reference#id">content</a>
```

 - **reference** is the file name of destination HTML or XHTML file
 - **id** is the id name of an element in the destination file
 - e.g.

```
<a href="glossary.htm#exposure">Exposure</a>
```

Tutorial 2, Math279, Fall 2013

22

Exercise (in glossary.htm)

```
<dt id="aperture"><b>Aperture</b></dt>
.....
<dt id="exposure"><b>Exposure</b></dt>
.....
<dt id="f-stop"><b>F-stop</b></dt>
.....
<dt id="flash_mode"><b>Flash Mode</b></dt>
.....
<dt id="focal_length"><b>Focal Length</b></dt>
```

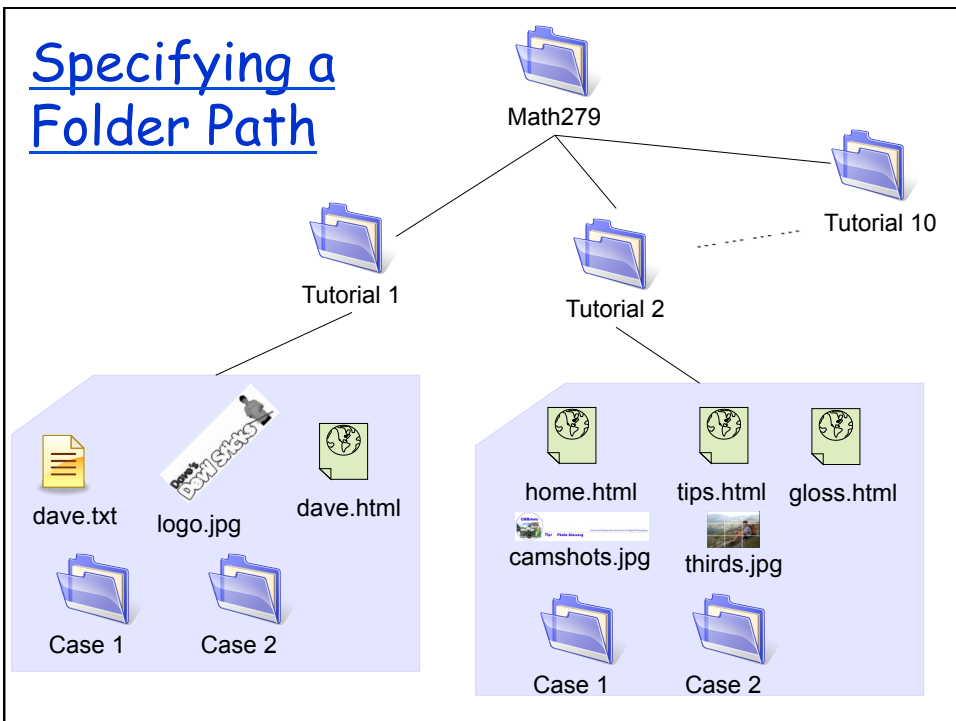

Exercise (in home.htm)

[illegible]

Homework

- ❑ Finish reading Tutorial 2
- ❑ Finish exercises shown in
 - Figure 2-9 (page 68-69)
 - Figure 2-15 to 2-20 (page 75 - 77)
 - Figure 2-21 to 2-23 (page 79-80)
 - Figure 2-34 to 2-35 (page 91-92)
 - Figure 2-40 (page 97)
 - Figure 2-42 (page 100)

Specifying a Folder Path

Specifying a Folder Path (cont.)

- ❑ to create a link to a file located in a different folder than the current document, specify the file's location, or **path**
- ❑ an **absolute path** specifies a file's precise location within a computer's entire folder structure
 - e.g., "C:\Fall13\Math279\Tutorial2\tips.htm"
- ❑ a **relative path** specifies a file's location in relation to the location of the current document
 - e.g.,
 - "Tutorial2/tips.htm"
 - "../Tutorial1/logo.jpg"
 - "thirds.jpg"

Tutorial 2, Math279, Fall 2013

27

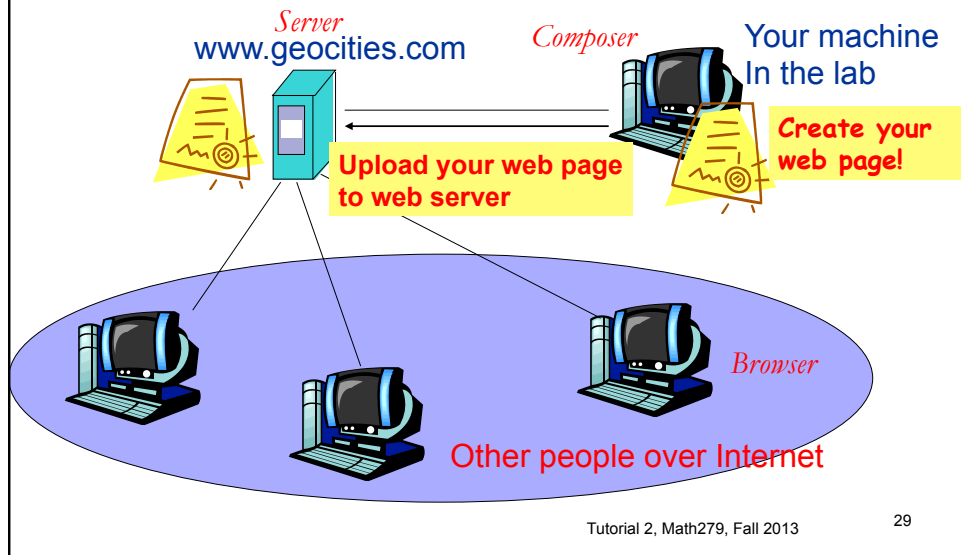

Specifying a Folder Path (cont.)

- ❑ to go one level up of the folder tree, start **relative path** with a double period, a forward slash, and then provide the name of the file
 - ../logo.jpg
- ❑ to specify a different folder on the same level, known as a **sibling folder**, move up the folder tree using the double period and then down the tree using the name of the **sibling folder**
 - ../Tutorial1/logo.jpg
- ❑ You should almost always use **relative paths** in your links

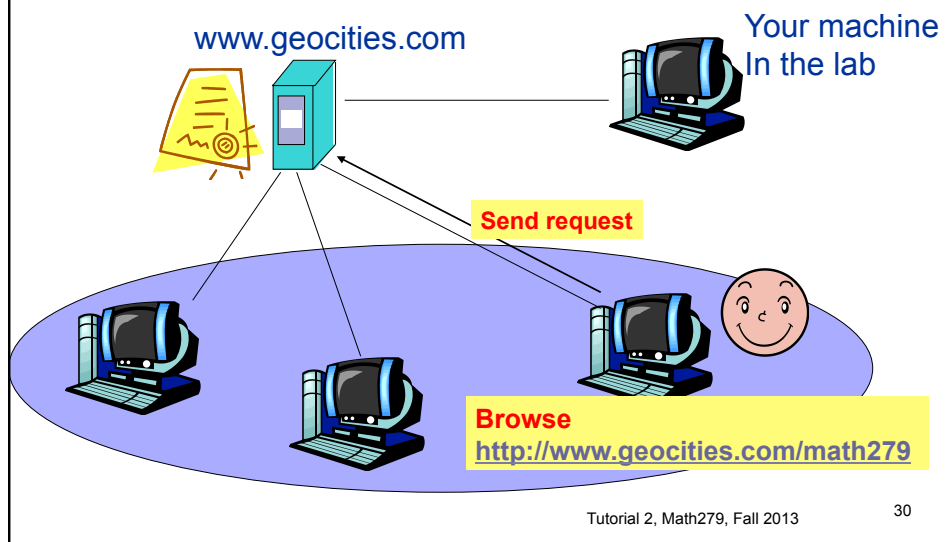

Tutorial 2, Math279, Fall 2013

28

How does WWW work?

How does WWW work?

URL (Uniform Resource Locators)

- ❑ Composer, browser, server can be at different machines over the Internet
- ❑ URL - specify web pages (i.e., HTML files) or images (i.e., image files)
 - server name
 - ❑  <http://www.jjay.cuny.edu/Math279/math279.html>
 - ❑ <http://www.geocities.com/math279>
 - path name (find html or image files on server)
 - ❑ <http://www.jjay.cuny.com/Math279/math279.html>
 - ❑ <http://www.geocities.com/tom/index.html>
 - ❑ <http://www.geocities.com/tom/mycat.jpg> 

Tutorial 2, Math279, Fall 2013

31

Linking to a web site

- ❑ add a hyperlink to a Web page on *other* Web server
- ❑ use Absolute (i.e. complete) URL for the link destination
- ❑ Example

```
<a href = "http://www.jjay.cuny.edu/"> John Jay
College of Criminal Justice</a>
<a href = "http://www.camshots.com/"> Camshots
Inc.</a>
<a href = "http://www.camshots.com/articles/
glossary.htm#aperture"> Aperture</a>
```

Tutorial 2, Math279, Fall 2013

32

Exercise (in tips.htm)

```
<dt>&#9758; <a href="http://www.apogeephoto.com">Apogee Photo</a></dt>
.....
<dt>&#9758; <a href="http://outdoorphotographer.com">Outdoor
Photographer</a></dt>
.....
<dt>&#9758; <a href="http://www.pcphotomag.com">PCPhoto</a></dt>
.....
<dt>&#9758; <a href="http://www.popphoto.com">Popular Photography and
Imaging</a></dt>
```

More hyperlinks

❑ link to an email address

- `Contact Me!`

❑ create clickable image

- ``

URL in

- ❑ Insert an image in your web page

- ❑ Use full URL

- ❑ Use relative URL

URL in (cont.)

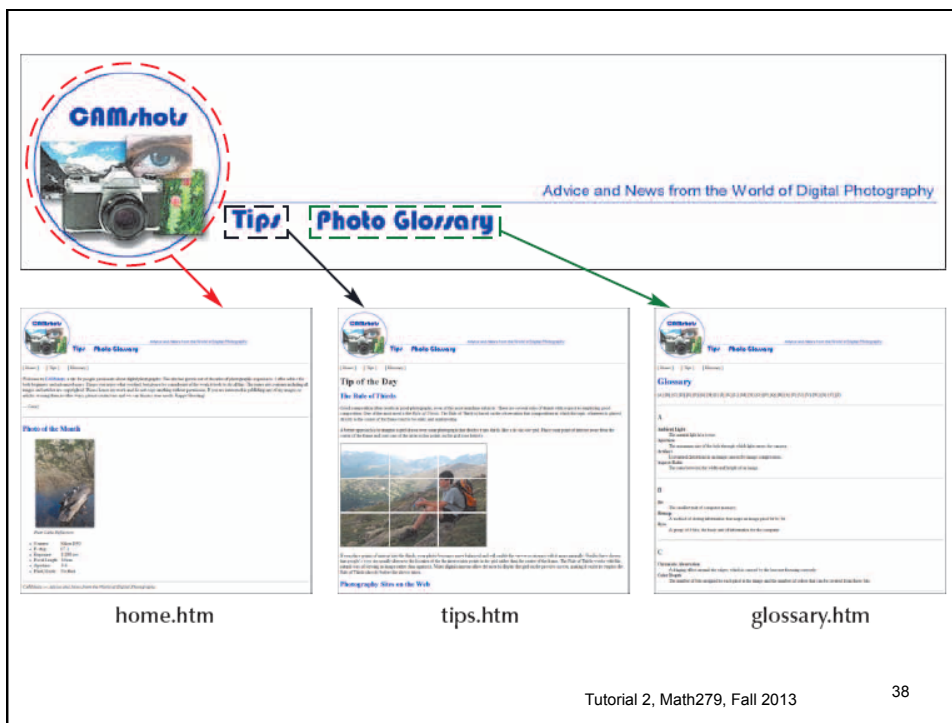

Suppose your web page (html file) is at http://www.geocities.com/tom/index.html

 is equivalent to

REMEMBER: upload your image file to the web server!

Working with image maps

- ❑ turn an image (website's logo) into a hypertext link pointing to a web page
``
- ❑ **image maps**: divide an image into different zones, or *hotspots*, each linked to a different destination

Defining hotspots

- ❑ to define hotspots, need to create an **image map** that matches a specified region of the inline image to a specific destination
- ❑ define a hotspot using two properties:
 - **shape**
 - **location** in the image
- ❑ syntax of hotspot element:

```
<area shape="shape" coords="coordinates"
      href="url" alt="text" />
```

Tutorial 2, Math279, Fall 2013

39

Creating a rectangular hotspot

- ❑ shape: **"rect"**
- ❑ two points define a **rectangular hotspot**:
 - the **upper-left corner**
 - the **lower-right corner**
- ❑ e.g.

```
<area shape="rect" coords="384,61,499,271"
      href="water.htm">
```

 - **coordinates**: are entered as a series of four numbers separated by commas
 - *first two numbers*: location of upper-left corner
 - *second two numbers*: location of the lower-right corner
 - the hotspot is a hypertext link to *water.htm*

Tutorial 2, Math279, Fall 2013

40

Creating a *circular* hotspot

- ❑ shape: “circle”
- ❑ two values define a circle hotspot
 - location of its center
 - radius
- ❑ e.g.

```
<area shape=“circle” coords=“307,137,66” href=“karts.htm”>
```

 - first two numbers (307, 137): coordinates of center
 - last number (66): radius in pixels
 - the hotspot is a hypertext link to karts.htm

Tutorial 2, Math279, Fall 2013

41

Creating a *polygonal* hotspot

- ❑ shape: “poly” or “polygon”
- ❑ need the coordinates for *each vertex* in the shape
- ❑ e.g.,

```
<area shape=“polygon”  
  coords=“13,60,13,270,370,270,370,225,230,225,230,60”  
  href=“rides.htm”>
```

 - each pair of numbers is the coordinates for one vertex in the shape
 - the hotspot is a hypertext link to rides.htm

Tutorial 2, Math279, Fall 2013

42

Creating a default hotspot

- ❑ shape: “default”
- ❑ any spot in the image that is not covered by another hotspot are set with the *default* hotspot link
- ❑ e.g.,

```
<area shape="default" coords="0, 0, x, y" ... />
```

x is the width and *y* is the height of the inline image

Creating image maps

- ❑ `<map> ... </map>` tags: define image map
 - used directly beneath `` tag, on which the image map applies
- ❑ `id`, and `name` attributes
 - have identical value
 - must be used with `<map>` tag
- ❑ e.g.:

```

<map id="logomap" name="logomap">
  <area shape="circle" coords="82,78,80" href="home.htm"
    alt="Home" />
  .....
</map>
```

Linking image map to an image

- ❑ **usemap** attribute
 - used with `` tag
 - with value `"#image_map_id"`
- ❑ **style** attribute
 - used with `` tag
 - set **border-width** to **0** to remove image border
- ❑ e.g.,
``

Tutorial 2, Math279, Fall 2013

45

Exercise: Putting things together

- ❑ in **home.htm** add the following code

```
<body>
<div>
  

  <map id="logomap" name="logomap">
    <area shape="circle" coords="82,78,80" href="home.htm"
      alt="Home" />
    <area shape="rect" coords="235,120,310,150" href="tips.htm"
      alt="Tips" />
    <area shape="rect" coords="340,120,510,150"
      href="glossary.htm" alt="Glossary" />
  </map>
</div>
```

Tutorial 2, Math279, Fall 2013

46

Exercise (cont.)

- in `tips.htm` and `glossary.htm` add the following code as well (you may use “copy” and “paste” from `home.htm`)

```
<body>
<div>
  
                                     style="border-width:0"/>
  <map id="logomap" name="logomap">
    <area shape="circle" coords="82,78,80" href="home.htm"
                                     alt="Home" />
    <area shape="rect" coords="168,110,225,145" href="tips.htm"
                                     alt="Tips" />
    <area shape="rect" coords="240,110,402,145"
                                     href="glossary.htm" alt="Glossary" />
  </map>
</div>
```

Tutorial 2, Math279, Fall 2013

47

Target attribute for hyperlinks

- specifies a window in which link destination should be displayed
- opens the link in a new window, new tab, or in the same window
- values for `target` attribute:
 - `_self` or `_top`: (the default) opens link in the current browser window or tab
 - `_blank` or `new`: opens link in a new, unnamed window or tab
 - e.g.
`F-stop`
`Aperture`

Tutorial 2, Math279, Fall 2013

48

Working with metadata

- ❑ Web authors hope sites appear more prominently in search engines
- ❑ **metadata**: information about the site
- ❑ use **meta** element in *head* section of the document
`<meta name="text" content="text" />`
- ❑ in recent years, search engines become more sophisticated in evaluating Web sites, meta element has decreased in importance

Meta Name	Example	Description
author	<code><meta name="author" content="Gerry Hayward" /></code>	Supplies the name of the document author
classification	<code><meta name="classification" content="photography" /></code>	Classifies the document
copyright	<code><meta name="copyright" content="© 2011 CAMshots" /></code>	Provides a copyright statement
description	<code><meta name="description" content="Digital photography and advice" /></code>	Provides a description of the document
generator	<code><meta name="generator" content="Dreamweaver" /></code>	Indicates the name of the program that created the HTML code for the document
keywords	<code><meta name="keywords" content="photography, cameras, digital" /></code>	Provides a list of keywords describing the document
owner	<code><meta name="owner" content="CAMshots" /></code>	Indicates the owner of the document
rating	<code><meta name="rating" content="general" /></code>	Provides a rating of the document in terms of its suitability for minors
reply-to	<code><meta name="reply-to" content="ghayward@camshots.com (G. Hayward)" /></code>	Supplies a contact e-mail address and name for the document

Working with metadata (cont.)

- ❑ http-equiv attribute: add information and commands to the communication stream
 - force Web browser to refresh the Web page at timed intervals
`<meta http-equiv="refresh" content="60" />`
 - redirect the browser from the current document to a new document
`<meta http-equiv="refresh" content="5;url=www.camshots.com" />`
 - specify the character set
`<meta http-equiv="Content-Type" content="text/html; charset=ISO-8859-1" />`

Homework

- ❑ Finish reading Tutorial 2
- ❑ Review assignment: Figure 2-49, page 125-127
- ❑ Case Problem 1: page 127-128
- ❑ Case Problem 3: page 130-132
- ❑ (extra credit) Case Problem 4: page 132-133
